

IN THE CLAIMS

Please amend the claims as follows:

Claim 1 (Currently Amended): An optical window deposition shield comprising:

- a backing plate having a through hole;
- a honeycomb structure ~~having~~ comprising plural adjacent corrugated sheets attached together to form a plurality of adjacent cells in spaces between the adjacent corrugated sheets, the cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell; and
- a coupling device configured to couple the honeycomb ~~core~~ structure to the backing plate such that the honeycomb structure is aligned with at least a portion of the through hole in the backing plate.

Claim 2 (Original): The optical window deposition shield of Claim 1, wherein said backing plate comprises aluminum sheet metal.

Claim 3 (Original): The optical window deposition shield of Claim 1, wherein said backing plate comprises anodized aluminum sheet metal.

Claim 4 (Original): The optical window deposition shield of Claim 1, wherein said backing plate is configured to be coupled to a chamber liner such that the through hole is at least partially aligned with a hole in the chamber liner.

Claim 5 (Original): The optical window deposition shield of Claim 4, wherein said through hole substantially contours the hole in the chamber liner.

Claim 6 (Original): The optical window deposition shield of Claim 1, wherein said honeycomb structure comprises aluminum.

Claim 7 (Original): The optical window deposition shield of Claim 6, wherein said honeycomb structure is coated with a protective coating.

Claim 8 (Original): The optical window deposition shield of Claim 6, wherein said protective coating comprises a compound including an oxide of aluminum.

Claim 9 (Original): The optical window deposition shield of Claim 6, wherein said protective coating comprises a compound including a mixture of  $\text{Al}_2\text{O}_3$  and  $\text{Y}_2\text{O}_3$ .

Claim 10 (Original): The optical window deposition shield of Claim 6, wherein said protective coating comprises a compound including at least one of a III-column element and a lanthanon element.

Claim 11 (Original): The optical window deposition shield of Claim 10, wherein the III-column element comprises at least one of yttrium, scandium, and lanthanum.

Claim 12 (Original): The optical window deposition shield of Claim 10, wherein the lanthanon element comprises at least one of cerium, dysprosium, and europium.

Claim 13 (Original): The optical window deposition shield of Claim 6, wherein said protective coating comprises at least one of yttria ( $\text{Y}_2\text{O}_3$ ),  $\text{Sc}_2\text{O}_3$ ,  $\text{Sc}_2\text{F}_3$ ,  $\text{YF}_3$ ,  $\text{La}_2\text{O}_3$ ,  $\text{CeO}_2$ ,  $\text{Eu}_2\text{O}_3$ , and  $\text{DyO}_3$ .

Claim 14 (Original): The optical window deposition shield of Claim 1, wherein said honeycomb structure is configured to fit snugly into a hole in a plasma processing chamber liner to provide a deposition shield within said hole in the chamber liner.

Claim 15 (Original): The optical window deposition shield of Claim 1, wherein said cells of the honeycomb structure have an aspect ratio of about four or more.

Claim 16 (Original): The optical window deposition shield of Claim 1, wherein said coupling device comprises a retaining flange that is detachably coupled to the backing plate by press contact when the backing plate is coupled to the chamber liner.

Claim 17 (Original): The optical window deposition shield of Claim 1, wherein said coupling device comprises at least one retaining pin fixed to the backing plate and configured to engage at least one cell of the honeycomb structure when the honeycomb structure is pressed over the at least one retaining pin.

Claim 18 (Original): The optical window deposition shield of Claim 17, wherein the at least one retaining pin is configured to engage the at least one cell of the honeycomb structure by deforming the cell.

Claim 19 (Original): The optical window deposition shield of Claim 1, wherein said coupling device comprises at least one threaded fastener fixed to the backing plate and configured to hold the honeycomb structure in contact with the backing plate.

Claim 20 (Original): An optical window deposition shield comprising:  
a honeycomb structure planar sheet having a plurality of adjacent cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell; and

a clip device configured to hold opposing ends of the honeycomb planar sheet together to form a substantially continuous liner of honeycomb material configured to line ~~the~~ a chamber wall of a plasma processing chamber.

Claim 21 (Currently Amended): A plasma processing chamber comprising:  
a chamber wall having an optical viewing window;  
a chamber liner having a liner hole that is substantially aligned with said viewing window to permit viewing an interior of the chamber through the viewing window and liner hole; and

an optical window deposition shield substantially aligned with said viewing window and liner hole, the optical viewing window deposition shield comprising[[:]]

a backing plate having a through hole[[:]],

a honeycomb structure ~~having comprising plural adjacent corrugated sheets attached together to form~~ a plurality of adjacent cells in spaces between the adjacent corrugated sheets, the cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient

to impede a processing plasma from traveling through the full length of the cell[[]],  
and

a coupling device configured to couple the honeycomb ~~core~~-structure to the  
backing plate such that the honeycomb structure is aligned with at least a portion of  
the through hole in the backing plate.

Claim 22 (Original): The plasma processing chamber of Claim 21, wherein said  
backing plate comprises aluminum sheet metal.

Claim 23 (Original): The plasma processing chamber of Claim 21, wherein said  
backing plate comprises anodized aluminum sheet metal.

Claim 24 (Original): The plasma processing chamber of Claim 21, wherein said  
backing plate is configured to be coupled to a chamber liner such that the through hole is at  
least partially aligned with a hole in the chamber liner.

Claim 25 (Original): The plasma processing chamber of Claim 24, wherein said  
through hole substantially contours the hole in the chamber liner.

Claim 26 (Original): The plasma processing chamber of Claim 21, wherein said  
honeycomb structure comprises aluminum.

Claim 27 (Original): The plasma processing chamber of Claim 26, wherein said  
honeycomb structure is coated with a protective coating.

Claim 28 (Original): The plasma processing chamber of Claim 26, wherein said protective coating comprises a compound including an oxide of aluminum.

Claim 29 (Original): The plasma processing chamber of Claim 26, wherein said protective coating comprises a compound including a mixture of  $\text{Al}_2\text{O}_3$  and  $\text{Y}_2\text{O}_3$ .

Claim 30 (Original): The plasma processing chamber of Claim 26, wherein said protective coating comprises a compound including at least one of a III-column element and a lanthanon element.

Claim 31 (Original): The plasma processing chamber of Claim 30, wherein the III-column element comprises at least one of yttrium, scandium, and lanthanum.

Claim 32 (Original): The plasma processing chamber of Claim 30, wherein the lanthanon element comprises at least one of cerium, dysprosium, and europium.

Claim 33 (Original): The plasma processing chamber of Claim 26, wherein said protective coating comprises at least one of yttria ( $\text{Y}_2\text{O}_3$ ),  $\text{Sc}_2\text{O}_3$ ,  $\text{Sc}_2\text{F}_3$ ,  $\text{YF}_3$ ,  $\text{La}_2\text{O}_3$ ,  $\text{CeO}_2$ ,  $\text{Eu}_2\text{O}_3$ , and  $\text{DyO}_3$ .

Claim 34 (Original): The plasma processing chamber of Claim 21, wherein said honeycomb structure is configured to fit snugly into a hole in a plasma processing chamber liner to provide a deposition shield within said hole in the chamber liner.

Claim 35 (Original): The plasma processing chamber of Claim 21, wherein said cells of the honeycomb structure have an aspect ratio of about four or more.

Claim 36 (Original): The plasma processing chamber of Claim 21, wherein said coupling device comprises a retaining flange that is detachably coupled to the backing plate by press contact when the backing plate is coupled to the chamber liner.

Claim 37 (Original): The plasma processing chamber of Claim 21, wherein said coupling device comprises at least one retaining pin fixed to the backing plate and configured to engage at least one cell of the honeycomb structure when the honeycomb structure is pressed over the at least one retaining pin.

Claim 38 (Original): The plasma processing chamber of Claim 37, wherein the at least one retaining pin is configured to engage the at least one cell of the honeycomb structure by deforming the cell.

Claim 39 (Original): The plasma processing chamber of Claim 21, wherein said coupling device comprises at least one threaded fastener fixed to the backing plate and configured to hold the honeycomb structure in contact with the backing plate.

Claim 40 (Currently Amended): An optical window deposition shield comprising:  
means for impeding processing plasma from traveling into contact with a viewing window of a plasma chamber and for allowing viewing through cells formed between attached adjacent corrugated sheets; and

means for holding the means for impeding within an opening of a chamber liner used in the plasma chamber.

Claim 41 (Currently Amended): A method for impeding a processing plasma from traveling into contact with a viewing window of a plasma chamber, the method comprising;  
providing a mounting hole in a liner of the plasma chamber; and  
fixedly mounting a honeycomb structure within the mounting hole, said honeycomb structure having comprising plural adjacent corrugated sheets attached together to form a plurality of adjacent cells in spaces between the adjacent corrugated sheets, the cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell.

Claim 42 (New): An optical window deposition shield comprising:  
a backing plate having a through hole;  
a honeycomb structure comprising a plurality of adjacent cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell; and  
a coupling device configured to couple the honeycomb structure to the backing plate such that the honeycomb structure is aligned with at least a portion of the through hole in the backing plate and comprising a retaining flange that is detachably coupled to the backing plate by press contact when the backing plate is coupled to a chamber liner.

Claim 43 (New): An optical window deposition shield comprising:

a backing plate having a through hole;

a honeycomb structure comprising a plurality of adjacent cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell; and

a coupling device configured to couple the honeycomb structure to the backing plate such that the honeycomb structure is aligned with at least a portion of the through hole in the backing plate and comprising at least one retaining pin fixed to the backing plate and configured to engage at least one cell of the honeycomb structure when the honeycomb structure is pressed over the at least one retaining pin.

Claim 44 (New): The optical window deposition shield of Claim 43, wherein the at least one retaining pin is configured to engage the at least one cell of the honeycomb structure by deforming the cell.

Claim 45 (New): A plasma processing chamber comprising:

a chamber wall having an optical viewing window;

a chamber liner having a liner hole that is substantially aligned with said viewing window to permit viewing an interior of the chamber through the viewing window and liner hole; and

an optical window deposition shield substantially aligned with said viewing window and liner hole, the optical viewing window deposition shield comprising

a backing plate having a through hole,

a honeycomb structure comprising a plurality of adjacent cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect

ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell, and

a coupling device configured to couple the honeycomb structure to the backing plate such that the honeycomb structure is aligned with at least a portion of the through hole in the backing plate and comprising a retaining flange that is detachably coupled to the backing plate by press contact when the backing plate is coupled to the chamber liner.

Claim 46 (New): A plasma processing chamber comprising:

a chamber wall having an optical viewing window;

a chamber liner having a liner hole that is substantially aligned with said viewing window to permit viewing an interior of the chamber through the viewing window and liner hole; and

an optical window deposition shield substantially aligned with said viewing window and liner hole, the optical viewing window deposition shield comprising

a backing plate having a through hole,

a honeycomb structure comprising a plurality of adjacent cells configured to allow optical viewing through the honeycomb structure, each cell having an aspect ratio of length to diameter sufficient to impede a processing plasma from traveling through the full length of the cell, and

a coupling device configured to couple the honeycomb structure to the backing plate such that the honeycomb structure is aligned with at least a portion of the through hole in the backing plate and comprising at least one retaining pin fixed to the backing plate and configured to engage at least one cell of the honeycomb structure when the honeycomb structure is pressed over the at least one retaining pin.

Claim 47 (New): The plasma processing chamber of Claim 46, wherein the at least one retaining pin is configured to engage the at least one cell of the honeycomb structure by deforming the cell.
